

# Energy Management

One of our maxims at LIQUI MOLY GmbH and MEGUIN GmbH & Co. KG is the responsible handling of energy in the form of electricity, fossil fuels and district heating. All employees can contribute to saving energy and thus reduce costs for the company and protect the environment.

## The following measures must be observed:

### General:

- ❖ Leaving a window tilted open draws heat from the room and brings little fresh air in. Brief opening the window provides the room with sufficient fresh air and does not get cool down furniture.
- ❖ When leaving the room, be sure to check if the light needs to stay on; lighting in unused rooms should be switched off.
- ❖ For long absences, all electrical devices should be turned off.
- ❖ Avoid unnecessary water usage.

### Production:

- ❖ Care must be taken to ensure that all systems are properly maintained.
- ❖ Leaks or unusual sounds on compressed air lines must be reported to supervisors.

### Office:

- ❖ When purchasing new equipment, we make sure that energy-efficient devices are acquired (e.g. energy efficiency class A+++).
- ❖ Stand-by mode should be used on devices that need to be in constant operation (e.g. fax machines).
- ❖ When setting the room temperature, it should be noted that for each degree less, about 6% heating energy is saved.

A handwritten signature in black ink, appearing to read 'Ernst Prost', is written over a vertical line.
